SERVICE OVERVIEW

Private Cloud Hosting

Your servers run in our cloud or at your office on the same platform, continuously replicated so a failure at one location doesn't stop your business.

RECOVERY POINT (RPO)

10 min

At most ten minutes of data lost, because changes replicate continuously.

RECOVERY TIME (RTO)

60 min

Servers back online within an hour of a declared disaster.

What these numbers mean

RPO is how much recent work could be lost. RTO is how long until you are working again.

HOW REPLICATION WORKS

YOUR OFFICE

On-site server

Runs on the same platform as our cloud, close to your staff.

→ REPLICATES

PRIMARY

Data center A

Hosts cloud servers and receives replicas from on-site servers.

→ REPLICATES

SECONDARY

Data center B

A geographically separate copy, ready if a whole site goes down.

IF YOUR OFFICE GOES DOWN

01

Disaster

Fire, flood, ransomware or hardware failure takes the office server offline.

02

Failover

Your servers start in our cloud from the most recent replica.

03

Work continues

Staff reconnect to the cloud copy from the office or from home.

04

Fail back

Once the site is repaired, changes sync back and servers return on site.

BUILT INTO EVERY ENVIRONMENT

- ✓ Replication between geographically separate data centers
- ✓ Private infrastructure run by us, not the public cloud
- ✓ Encrypted replication and storage
- ✓ Firewall, monitoring and patching managed by us
- ✓ Replication and backups monitored continuously
- ✓ The same platform on site and in the cloud

ON SITE OR IN THE CLOUD

One platform, both places

Keep servers at your office for local speed, host them with us, or mix the two. Because the technology matches, a server can move between them without being rebuilt.
